Final Assignment

For my assignment I didn't end up needing what people wrote their how-tos on. There were a few how-tos for website layouts, but I chose to do it by hand instead to get more practice with CSS. It isn't perfect, but I have a better foundation for any future projects with CSS than I did before.

I did use code from around the web as follows:

The simple PHP image upload functions are from [http://www.reconn.us/file\\_uploading.html](http://www.reconn.us/file_uploading.html)

I edited it a bit because I decided to only use '.jpg' for images to make the image lookup for each user easier. I now realize I could have stored the image name and extension in a database to allow for any name/extension combo, but I ran out of time to implement this. The form provided in this small library does throw an error in the W3 validator.

For toggling divs I used this tutorial:

<https://www.washington.edu/accesscomputing/webd2/student/unit5/module2/lesson5.html>

Although this one needed a bit of editing to work with a div id passed as a parameter, since that one had a hard-coded example.

For testing, you can quickly create two accounts and have them add each other as friends to see the profile photos and lists displayed for you to see as well.
